

# Genome Announcement: *Lactobacillus jensenii*

Accession#SRR28592994 (NCBI)  
#INS0004612 (IBDC)

## 1. Genome Sequencing

**BRIC-THSTI**  
presenting the whole  
genome sequence  
of *Lactobacillus*  
*jensenii* from the  
reproductive tract of  
Indian women.

## 2. Analysis

The genomic analysis highlights *L. jensenii*'s capacity for intermicrobial competition, evidenced by its roles in pathogen inhibition, niche adaptation, and regulation of vaginal health.

## 3. Insights

Genomic insights reveal *L. jensenii*'s metabolic flexibility via Neopullulanase, stress resilience through the SUF Fe-S system, and antimicrobial peptide production that protects the reproductive tract.

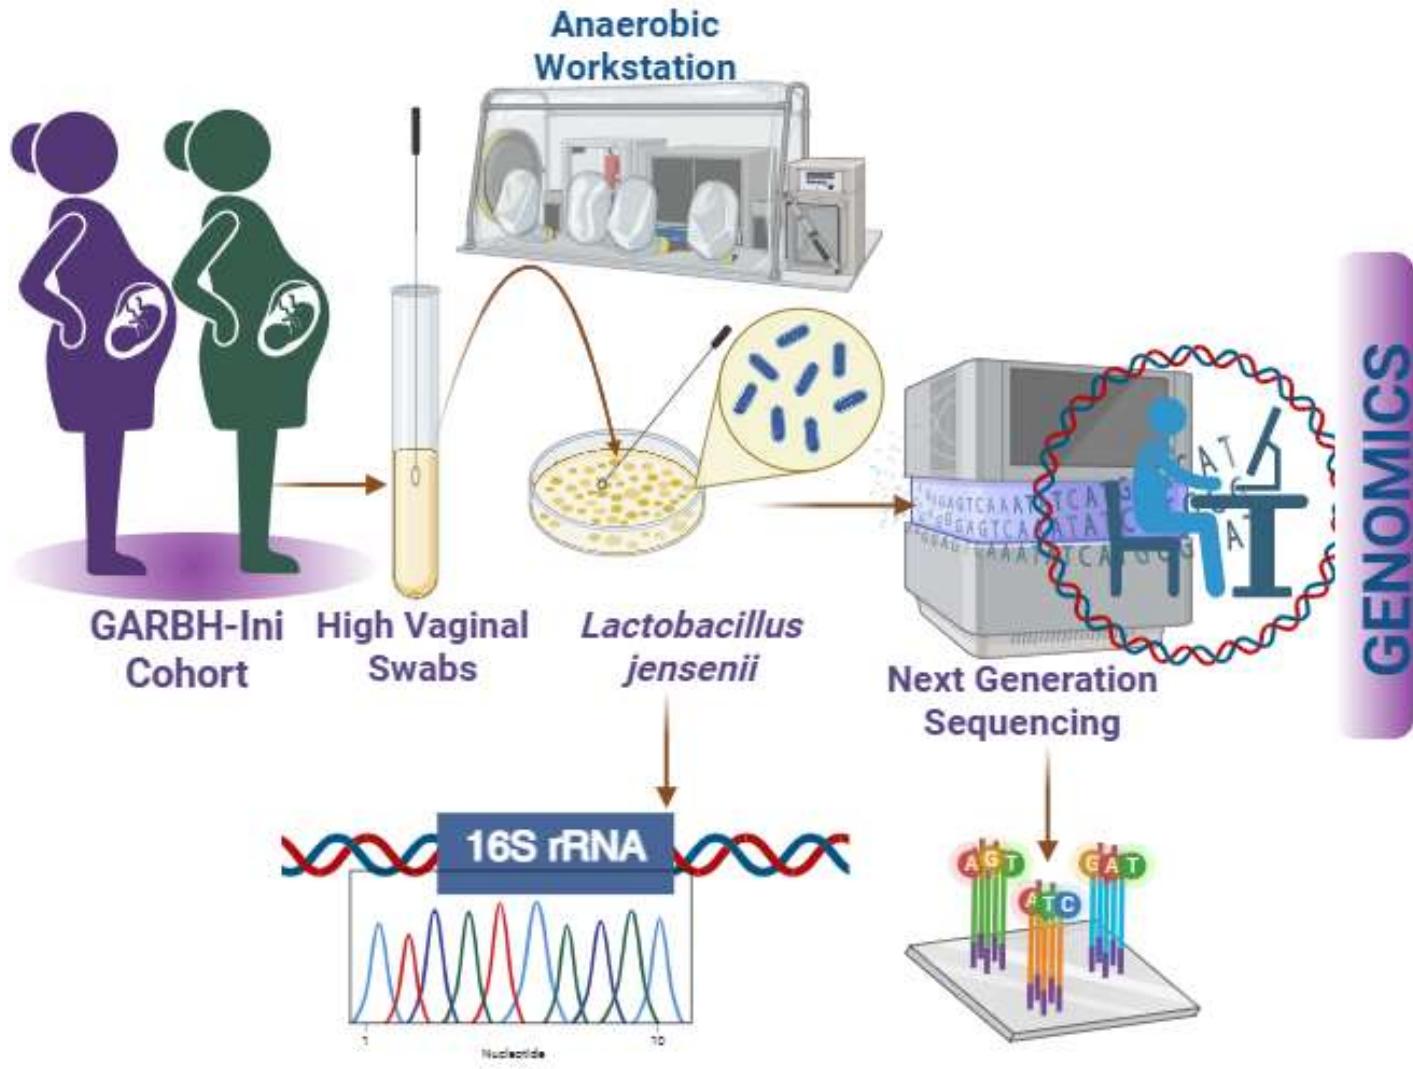

## 4. Translation

These findings support the development of live biotherapeutics aimed at preventing bacterial vaginosis and reducing preterm birth risk.

***Lactobacillus jensenii*: The vaginal sentinel turning host sugars into a secreted peptide shield**

# Whole Genome sequence of *Lactobacillus jensenii*

Genome size: 1.5mb  
GC percent: 34.2  
RNAs: 60  
Subsystems: 177  
Transcription factors:  
Helix turn helix  
transcriptional regulator

Antimicrobial peptides:  
NRPS  
Secretory signal  
peptides: 3  
Neopullulanase: 1  
SufB: 1, SufD: 1
